NOTES ON THE TABLES

This volume contains monthly and annual normals of temperature from 1395 stations in all regions of Canada. The stations are presented in alphabetical order by Province or Territory and data are listed for stations with an appreciable period of record over the period 1941-1970. The actual period of record used to compute the means may be determined through the use of code numbers which appear in the column "Type of Normal".

The code is as follows:

Code	Type of Normal
1	30 years between 1941 and 1970, or more
2	25 to 29 years between 1941 and 1970
3	20 to 24 years between 1941 and 1970
4	15 to 19 years between 1941 and 1970
5	10 to 14 years between 1941 and 1970
6	less than 10 years
7	combined data from 2 or more stations
8	adjusted
9	estimated

In order to obtain representative observations, all temperature reporting stations are equipped with standard shelters in which the thermometers are housed. The thermometers are self-registering mercury maximum and spirit minimum thermometers which are hung four feet above the surface of the ground, and are usually read two or four times daily. Ideally each shelter is located in the most representative location possible, and is installed over level grassy terrain, where practicable, in a spot away from the sheltering influence of trees and buildings.

At most stations the maximum thermometer is read twice daily but at some only once daily. Because mercury freezes at -38°F (-39°C) such thermometers cannot be used at temperatures below this value. At most climatological stations the maximum temperature is based on a day ending with the morning observation, usually about 8 a.m. the next day. The minimum temperature for the day is based on a day ending with the evening observation, usually about 5 p.m. the same day.

The mean daily maximum temperature for any month is the mean of all daily maximum temperatures recorded in that particular month for the period of record. The mean daily minimum temperature is similarly derived from all daily minimum temperature observations. The mean daily temperature is the average of the monthly maximum and monthly minimum temperatures and may not be exactly equal to the mean of the normal maximum and minimum temperatures.

The temperature extremes are the absolute maximum and minimum values observed over the entire period of record at each station up to and including 1970. In each case the number of years is given below the extreme.

A day with frost is defined as a day on which the daily minimum temperature recorded is 32°F or lower.

REMARQUES RELATIVES AUX TABLEAUX

Cet ouvrage précise les normales mensuelles et annuelles de température relevées par 1395 stations réparties sur l'ensemble du Canada. Ces stations sont énumérées par ordre alphabétique pour chaque province ou territoire et les chiffres émanent des stations qui de 1941 à 1970, ont effectué des relevés pendant une période appréciable. La période réelle pendant laquelle les relevés ont été utilisés pour calculer les moyennes peut s'obtenir en se référant à la codification qui figure dans la colonne "Type of Normal".

Voici l'explication de ce code:

- 1 30 ans ou plus, entre 1941 et 1970
- 2 de 25 à 29 ans, entre 1941 et 1970
- 3 de 20 à 24 ans, entre 1941 et 1970
- 4 de 15 à 19 ans, entre 1941 et 1970
- 5 de 10 à 14 ans, entre 1941 et 1970
- 6 moins de 10 ans
- 7 données de 2 stations ou plus combinées
- 8 corrigé
- 9 estimation

Toutes les stations d'observation des températures sont dotées d'abris dans lesquels sont placés les thermomètres, afin que les données obtenues soient représentatives. Ces thermomètres sont du type enregistreur à maxima au mercure, et à minima à liquide organique, suspendus à 4 pieds au-dessus du sol; on en fait ordinairement la lecture deux ou quatre fois par jour. Dans la mesure du possible, chaque abri est installé à l'endroit le plus représentatif possible, sur un terrain plan gazonné, loin de l'influence de l'ombre des arbres et des bâtiments.

À la plupart des stations, on effectue deux lectures quotidiennes du thermomètre à maxima, mais à certaines stations, on ne relève qu'une seule lecture par jour. Étant donné que le mercure gèle à -38°F (-39°C), les thermomètres à mercure sont inutilisables à des températures inférieures à cette valeur. À la plupart des stations climatologiques, la température maximale est basée sur une journée prenant fin avec l'observation du matin, habituellement vers 8 heures, le lendemain du jour pour lequel l'observation est faite. La température minimale quotidienne est basée sur une journée prenant fin avec l'observation du soir habituellement vers 17 heures, le même jour.

La température maximale quotidienne moyenne pour un mois quelconque est la moyenne de toutes les températures maximales quotidiennes enregistrées au cours de ce mois dans la période de relevés. De même, la température minimale quotidienne est calculée à partir de toutes les observations météorologiques minimales quotidiennes. La température quotidienne moyenne est donnée par les températures mensuelles maximales et minimales; il se peut qu'elle ne soit pas égale à la moyenne des températures minimales et maximales normales.

Les températures extrêmes représentent les valeurs absolues minimales et maximales observées au cours d'une période complète de relevés à chaque station, jusqu'à 1970 inclusivement. Dans chaque cas, le nombre d'années est indiqué au-dessous de la valeur donnée.

Un jour de gel se définit comme un jour durant lequel la température minimale diurne est inférieure ou égale à 32°F .
