PRECIPITATION

PRÉCIPITATIONS

1941 - 1970

CANADIAN NORMAL PRECIPITATION, 1941 - 1970

FOREWORD

This volume of Climatic Normals has been compiled to provide the most up-to-date normal, mean and extreme values arranged by element and based on the standard normal period 1941 to 1970 for an increasing number of observing stations throughout Canada.

The precipitation values in this book have previously been published on a regional basis while the present volume contains statistical data for stations across the nation arranged in separate sections for mean monthly and annual totals of rain, snow and total precipitation, greatest 24-hour amounts of rain, snow and total precipitation and number of days with measurable amounts of rain, snow and total precipitation.

It is only fitting to dedicate this volume to the thousands of daily weather observers whose unswerving sense of duty has made its publication possible.

NORMALES DES PRÉCIPITATIONS POUR LE CANADA DE 1941 À 1970

AVANT-PROPOS

Le présent recueil de normales climatiques a pour but de regrouper les valeurs normales, moyennes et extrêmes les plus à jour en les classant par éléments. Ces valeurs sont fondées sur les données recueillies pendant la période normale standard de 1941 à 1970 par un nombre croissant de stations d'observation dans tout le Canada.

Les valeurs des précipitations dont il est question ici ont été publiées antérieurement à l'échelle régionale, mais le présent ouvrage regroupe les données statistiques de stations réparties dans tout le Canada. Il consacre des sections distinctes aux moyennes mensuelles et annuelles des chutes de pluie, de neige et de précipitations totales, aux chutes de pluie, de neige et de précipitations totales les plus fortes en 24 heures et aux nombres de jours au cours desquels les chutes de pluie, de neige et de précipitations totales étaient mesurables.

Il est tout à fait naturel de dédier ce recueil aux milliers d'observateurs météorologistes qui, grâce à leur travail consciencieux et soutenu, ont rendu cette publication possible.

CONTENTS

	Page
Notes on the Tables	v
Mean Rainfall	1
Mean Snowfall.	26
Mean Total Precipitation	51
Greatest Rainfall in 24 Hours	76
Greatest Snowfall in 24 Hours	136
Greatest Precipitation Total in 24 Hours.	196
Number of Days with Measurable Rain.	256
Number of Days with Measurable Snow	281
Number of Days with Measurable Precipitation	306

Chute de pluie la plus forte en 24 heures	76
Chute de neige la plus forte en 24 heures	136
Précipitation totale la plus forte en 24 heures.	196
Nombre de jours de pluie mesurable	256
Nombre de jours de neige mesurable.	281
Nombre de jours de précipitation mesurable	306

NOTES ON THE TABLES

The precipitation observations upon which these normals are based were taken according to the procedures standard in the Atmospheric Environment Service (formerly Canadian Meteorological Service) during the period 1941 to 1970. Rainfall measurements were made with two kinds of rain gauge officially in service during the transition period. The old gauge is made of copper, has a circular opening of about 10 square inches, which is exposed at a height of 12 inches above level ground. It has a capacity of $4\frac{1}{2}$ inches of rain. The new rain gauge (Type B) has increased capacity amounting to 10 inches of rain; its opening stands 16 inches above level ground. In order to prevent obstructions from affecting the catch both types are, as far as possible, to be located on level ground with no obstacles nearer than four times their vertical extent. At this time (1973) most stations are still equipped with the old Standard Rain Gauge. However, plans are to eventually replace all Standard Rain Gauges with the Rain Gauge Type B.

With the introduction of the Snow Gauge from 1961 on at most principal observing stations the procedures of measuring snowfall also underwent some change. The Snow Gauge measures the actual amount of water equivalent of freshly fallen snow. At the remainder of observing stations snow depth measurements were carried out using rulers as before and total precipitation was determined by adding the rainfall and 10 percent of the snowfall determined by snow ruler. The observer is instructed to choose an area not affected by drifting and to make several measurements a few feet apart and average them. Where snow gauges are in use the procedure for determining the total precipitation consists of adding the catch of the rain gauge to the (liquid equivalent) catch of the snow gauge. Since the water equivalent of freshly fallen snow varies with the temperature and other factors, readings taken from snow gauges are bound to be superior in accuracy to those obtained with the snow ruler.

Separate tables are given for each element, in alphabetical order by province or territory from west to east. The last column on the right hand side of each table gives information on the length of record used at each station in code form. This code is as follows:

Code	Type of Normal
1	30 years between 1941 and 1970, or more
2	25 to 29 years between 1941 and 1970
3	20 to 24 years between 1941 and 1970
4	15 to 19 years between 1941 and 1970
5	10 to 14 years between 1941 and 1970
6	less than 10 years
7	combined data from two or more stations
8	adjusted
9	estimated

REMARQUES SUR LES TABLEAUX

Les normales de précipitation données dans le présent recueil s'appuient sur des observations effectuées conformément à la norme en vigueur au Service de l'environnement atmosphérique (autrefois connu sous le nom de Service météorologique du Canada) au cours de la période allant de 1941 à 1970. Les mesures pluviométriques ont été faites au moyen des deux types de pluviomètres officiellement utilisés pendant la période de transition. L'ancien pluviomètre en cuivre a une ouverture circulaire d'une superficie d'environ 10 pouces carrés qui est exposée à 12 pouces au-dessus du niveau du sol. Ce pluviomètre a une capacité de $4\frac{1}{2}$ pouces de pluie. Le nouveau pluviomètre, de type B, a une capacité plus forte - il peut en effet contenir 10 pouces de pluie. Son ouverture se trouve à 16 pouces au-dessus du niveau du sol. Pour éviter que l'engorgement du pluviomètre ne fausse la quantité de pluie recueillie, il faut autant que possible, placer les deux types de pluviomètres au niveau du sol et veiller à ce qu'il n'y ait aucun obstacle à une distance de moins de quatre fois sa hauteur. Au moment de la publication de cet ouvrage (1973) la plupart des stations utilisaient encore l'ancien pluviomètre standard. L'on prévoit cependant de remplacer tous les pluviomètres standard par des pluviomètres de type B.

L'introduction, à partir de 1961, du nivomètre dans la plupart des stations d'observation les plus importantes a amené certaines modifications dans les procédés de mesure nivométrique. Le nivomètre mesure la quantité réelle d'eau équivalent à la neige fraîchement tombée. Dans les autres stations d'observation, on a continué de mesurer la hauteur de neige à l'aide de règles comme par le passé et de déterminer les précipitations totales en faisant la somme de la chute de pluie et de 10 pour cent de la chute de neige mesurée à la règle à neige. L'observateur choisit une région dans laquelle il n'y a pas de poudrière au sol et fait la moyenne de plusieurs mesures effectuées à quelques pieds de distance. Dans les stations où l'on utilise le nivomètre, on détermine la précipitation totale en ajoutant la quantité de pluie recueillie dans le pluviomètre à l'équivalent liquide de la quantité de neige recueillie dans le nivomètre. Comme la quantité d'eau équivalent à de la neige fraîche varie en fonction de la température et d'autres facteurs, les relevés du nivomètre sont plus précis que les résultats obtenus à la règle à neige.

On trouvera des tableaux séparés pour chaque élément, classés dans l'ordre alphabétique par province ou territoire de l'ouest à l'est. La dernière colonne à droite dans chaque tableau indique, sous forme de code, la durée des relevés pour chaque station. Voici la signification des codes:

Code	Type de normale
1	30 ans ou plus, entre 1941 et 1970
2	de 25 à 29 ans, entre 1941 et 1970
3	de 20 à 24 ans, entre 1941 et 1970
4	de 15 à 19 ans, entre 1941 et 1970
5	de 10 à 14 ans, entre 1941 et 1970
6	moins de 10 ans
7	données combinées de deux stations ou plus
8	données corrigées
9	données estimatives
